

C语言阶段

知识体系

单元五：结构体与链表

能力考评

1、在little-endian(小端存储)机器，以下代码的输出是_____

```
union
{
    int i, j;
    char a, b;
}x;

int main(void)
{
    x.a = 1;
    x.b = 2;
    x.j = x.a + x.b;
    x.i = x.a + x.j;

    printf("0x%x\n", x.i);
    return 0;
}
```

2、32位机器，以下代码的输出结果_____。

```
#include <stdio.h>
int main()
{
    char* p;
    char* q[20];
    char m[20][20];
    int(*n)[10];
    struct Mystruct
    {
        char dda;
        double dda1;
        int type;
    };
    struct Mystruct k;
    printf("%d,%d,%d,%d,%d", sizeof(p), sizeof(q), sizeof(m), sizeof(n),
    sizeof(k));
    return 0;
}
```

3、分析如下代码的执行结果

```
#include<stdio.h>
struct test
```

```

{
    int num1;
    char* pcName;
    short sData;
    char cha[2];
    short sBa[4];
}*p;
int main()
{
    p = 0x100000;
    printf("%p\n", p+0x1);
    printf("%x\n", (unsigned long)p + 0x1);
    printf("%p\n", (unsigned*)p + 0x1);
    return 0;
}

```

4、分析下面代码的错误_____

```

struct student
{
    char* name;
    int score;
}stu,*pstu;
int main()
{
    pstu = malloc(sizeof(struct student));
    strcpy(pstu->name, "Jim");
    pstu->score = 99;
    free(pstu);
    return 0;
}

```
